DID YOU KNOW

At 0°F, a lead-acid battery has only about 40% of the cranking power it has at 80°F, yet the engine requires significantly more power to turn over due to thickened oil. When jump-starting in extreme cold, the gauge (thickness) of your booster cables is critical. Heavy-duty 4-gauge welding cable stranding allows for a high current flow with minimal resistance, ensuring that the limited power available is delivered efficiently to the dead battery without the cables overheating or losing flexibility.
